## Thermostats

Lux family of thermostats features a large selections of models for any residential or commercial application. Available in Mechanical, Programmable, Non-Programmable and Remotely controlled types.

Need help selecting the right model? See our [Thermostat Selection Guide](#).

Q: Which thermostat do I need?

A: Depending on the application, different thermostats may be used.

For radiant heating applications, heat only programmable and non-programmable versions are the best. A heat only, battery powered, digital non-programmable thermostat can easily service a single zone (room). For improved performance and money saving purposes, programmable versions can be used.

Forced air heating and cooling systems can be controlled with Mechanical thermostats and depending on the system's complexity, can be heat only, 1 heat / 1 cool, 2 heat / 2 cool and so on.

A new line of Outlet thermostats will allow to control portable air heaters. Simply plug the thermostat into the socket, plug the heater into the thermostat, set the temperature and done.

Programmable Thermostats allow for a more precise indoor temperature control, and many feature options such as 7-day programming, 5+2 days programming, etc.

Q: What is 5+2 days programming?

A: It means that the thermostat you're using can be programmed for 5 business days at the selected temperature and 2 weekend days at the selected temperature.

5+1+1 thermostats can be programmed separately for Saturday and Sunday.

TESTED 01-JUNE
